eBoMs are created in engineering, are typically driven from the CAD tool, and are usually centric to the final assemblies list of parts or components that make up the as designed or eBoM. mBoMs will contain, or be ‘driven’ by the eBoM. MBoMs make up the ‘end item’, or product as shipped.

Knowledge and understanding of statics is essential before using anything automated. I continually emphasis with RAPT software that designers should not be using it until they can regularly complete the same designs by hand calculation and have a full understanding of the design code they are using and the detailing requirements for structures.

Free SIMPLIS Simulation Files: when writing this book on transfer functions, I have extensively used SIMPLIS to confirm the results obtained with Mathcad and SPICE were correct. The many hours spent in simulating transfer functions of various converters lead me to aggregate all the circuits in ready-to-simulate templates which, for most of them, can work on the free demonstration version Element .

Many times, you simply don't know the impedance of the load. The result of that is that my expression for ICO-RMS comes out higher than real life, because the RMS value of the output current is higher than its average value. I'm perfectly okay with that, since it causes a slight over design, and I call that engineering margin.
